This exercise is intended to evaluate the candidate's ability to create a basic web application. You will be asked to review and/or demonstrate your solution during the interview. Note that this is not a pass/fail scenario, but rather an opportunity for us to understand the way you approach a problem.

We will be looking for the following:

- Correctness – The application functions as-intended and you implemented a reliable solution.
- Code Quality – The application is reliable and maintainable. The solution should be easy to understand using best practices.
- Aesthetics – The UI should include basic design elements to improve the user experience.

Task: Areté Office 3-Day Forecast

Create a basic application that displays the 3-day forecast at various Areté offices using the National Weather Service API (https://api.weather.gov/). The user selects the office location from a dropdown, then clicks a button to see a 3-day forecast with the date, temperature, and probability of precipitation. The office locations and information on the API endpoints are provided in script.js.

You are provided with three files to form the shell of the application. You are permitted to edit all aspects of these files to improve their structure, quality, and functionality. The task should be completed with raw JavaScript, HTML, and CSS.
